Professor Patrick L. Healey

ACKNOWLEDGEMENTS

No one "goes through" graduate school alone. The accomplishment of a graduate degree by an individual is the only tangible result to show for the dedicated work, personal sacrifice, and unselfish giving of many, many people. As the recipient of this degree, it is therefore impossible for me to adequately express the appreciation that I have for the many people who have so willingly supported me psychologically, emotionally and financially throughout my years as a graduate student. However, I must try.

To my dissertation committee I owe special thanks: first and foremost I thank you, Dr. W. W. Thomson. You have certainly been the foundation of my education. Your inspiration and consistent support have allowed me to achieve my goals. Your generosity of time and patience have given me the opportunity to realize my potential. No words can express my appreciation, so I can only hope that my accomplishments in the future will reflect your contribution, and that you will realize that I acknowledge your support, and that I share any success with you.

My very sincere appreciation is also felt for you, Dr. Roy Young. Your invaluable time and efforts in the lab, explaining the techniques, helping with the experiments, and giving advice on the results, as well as the benefit of your personal friendship have made my graduate career possible and enjoyable.

My thanks also go to you, Dr. Pat Healey. You probably don't realize it, but your interest in, and openness with your students was a big help to me as an undergraduate at U. C. Irvine. You helped me realize that I could communicate to the faculty, and that "they" would listen. Your enthusiastic help and support as part of my committee has reinforced my confidence and your suggestions and help on my dissertation have been invaluable.

Additionally, I would like to say a special thanks to you, Dr. Rachel Leech. Our scientific discussions have been invaluable learning experiences for me, and I look forward to continued collaboration and a long friendship. I especially appreciate your comments and criticisms on the manuscript for chapter three.

There are so many others: Roland, Beth, John and Alice; graduate students in the lab when I came to U. C. R. You helped me get started, and taught me the ropes. Thank you for my initiation to electron microscopy and, more importantly, to graduate school. You, and the other graduate students in our lab John K., Neil, Jerry, Tina, Curt, John O., and Chris; and our Post Doc, Tony Thank you all for your time and understanding. You helped in so many ways from silliness to science; from humor to hard work. Thank you.

I also owe a special thanks to the Department of Botany and Plant Science, especially Dean Duggar and Dr. Coggins as well as everyone on the staff, for your help, friendly cooperation, and support over the years. Thank you, Janet and Lee for helping get avocados and help with the respiration measurements. I want to thank you, Susanna, especially, for efficiency and expertise in typing the manuscripts (and all their revisions). I also thank you, Alice Carroll, for your expert help in typing.

The most difficult ones to thank are my family; my mother and father, my parents-in-law, Grandma Ruth; Judy and John, Michael and Laura; Bill and Lori, Jeremiah; Elaine , Kairin and Erinn; Greg and Mary, Mary and Therese; Steve and Linda, Stevie and

Matthew; and Esther. My visits have been few and far between; letters have been almost non-existent. I appreciate your understanding, your encouragement and enthusiasm, and your help. You all have made my graduate career more enjoyable; I couldn't have done it without you.

Finally, Roland. What can I say? You have been my strength. You have been my determination. You have been my sounding board for all the frustrations and tensions of the past six years. You have been, and continue to be, all this and more. Your help and experience have given me a special advantage in my research, in my writing, and in everything I do. You have shown extraordinary patience, and giving, above and beyond any reasonable expectations. Thank you with all my heart.

Portions of this dissertation are preprints of material to be published in *Protoplasma* (Chapter 1), and *Botanical Gazette* (Chapter 2), and have been included with the permission of the publishers. The coauthors listed in those publications directed and supervised the research which forms the basis for this dissertation.

This research was supported by Grant BMS74-19987 awarded to Dr. W. W. Thomson from the National Science Foundation, and a Public Health Service grant, 5-S07 RR07010.

ABSTRACT OF THE DISSERTATION

Ultrastructure of Mature and Ripening Avocado (*Persea americana* Mill.)
Fruit Mesocarp; Scanning, Transmission and Freeze
Fracture Electron Microscopy

by

Kathryn Ann Platt-Aloia

Doctor of Philosophy, Graduate Program in Botany

University of California, Riverside, August 1980

Professor William W. Thomson, Chairman

The ultrastructure of mature avocado (*Persea americana* Mill, var. Hass), fruit mesocarp cells, and changes in the ultrastructure during ripening were examined. The purpose of the study was to determine whether avocado fruit exhibit ultrastructural changes during the ripening process which are indicative of degradation. An answer to this question would help to determine whether or not ripening in avocados, and possibly other fruits, should be considered a senescence phenomenon, or whether ripening precedes senescence. Thin section transmission electron microscopy was complemented by investigations with freeze fracture and scanning electron microscopy (SEM).

A new technique for the preparation of biological material for examination in the SEM was modified and improved. This technique involved the use of thiocarbohydrazide (TCH) as a ligand, binding to osmium tetroxide (OsO_4). Alternate treatments of tissue with OsO_4 and TCH renders all cellular constituents (walls, organelles, and inclusions) conductive to electrons. This procedure therefore eliminates the need for metal coating of the specimen, and allows the direct observation of subcellular organelles in the SEM. The use of this technique for SEM, in conjunction with thin section and freeze fracture electron microscopy provided a multifaceted approach to the study of changes in the ultrastructure of ripening avocado fruit.

The primary, and essentially the only, degradative change observed was in the cell walls. This was manifested as a loosening of the wall striations, probably due to loss of pectins, and by a separation and apparent shortening of the cellulose microfibrils in the post climacteric fruit. An association of wall degradation with the plasmodesmata was not apparent.

The mature parenchyma cell of an avocado fruit contained the normal complement of cellular organelles; nuclei, plastids, mitochondria, microbodies, etc. The major

constituents of these cells were the lipid or oil bodies. These occurred in the cytoplasm and were apparently not surrounded by a membrane.

The structure of the plastids varied with the location of the cell with reference to the external environment. Thus, chloroplasts were found in the outermost cells, and etioplasts occurred in the inner cells of the mesocarp.

Mitochondria, endoplasmic reticulum (ER) and the plasma membrane all exhibited apparent ultrastructural changes during the ripening process. The mitochondria of unripe avocado mesocarp cells are fairly elongate, branching organelles. During ripening, an apparent increased elongation was observed in the SEM. No other obvious structural change occurred. The ER of unripe fruit, as seen by the three-dimensional view possible in the SEM appeared as tubular or as sheet-like structures. As ripening progressed, the ER apparently became vesiculated and was frequently in close apposition to the plasma membrane.

The changes in the ultrastructure of the plasma membrane were detected primarily by freeze fracture electron microscopy, and were manifested as an increase in the density of intramembranous particles (IMPs) of the EF face at the climacteric peak. This greater density of IMPs at the peak was followed by a decrease in density in the post climacteric fruits to a level similar to that of preclimacteric, unripe fruits.

Based on the lack of cellular or organelle degradation detectable at the ultrastructural level, the primary conclusion of this dissertation is that ripening precedes senescence, and should not be considered as a senescence phenomenon. The significance of the increased particle density in the EF face of the plasma membrane is uncertain at this time. However its coincidence with the climacteric peak in respiration is also coincident with the peak of activity of cellulase, and polygalacturonase, and with the peak of ethylene production. Whether or not any of these physiological events can be directly related to the increased particle density depends on further studies.

LIST OF FIGURES

Chapter 1

1. Electron micrograph of a parenchyma cell from the mesocarp of an unripe avocado prepared by the OTO fixation procedure. 15
2. Scanning electron micrograph of a parenchyma cell from the mesocarp of an unripe avocado showing internal organelles. 15
3. Electron micrograph of a portion of a mesocarp cell prepared by the OTO method and thin sectioned, showing increased electron density of cellular membranes and lipid bodies. 17
4. Electron micrograph of a portion of a mesocarp cell prepared by normal procedures for comparison of quality of preservation by the OTO method shown in fig. 3. 17
5. Scanning electron micrograph showing vesiculating ER, oil bodies and vesicles. 19
6. Scanning electron micrograph of subcellular organization showing sheet-like ER, vesicles and oil bodies. 19

Chapter 2

1. Thin-section electron micrograph of the cell wall of a hard, unripe avocado. 30
2. Scanning electron micrograph of a mesocarp cell of a hard, unripe avocado. 30
3. Electron micrograph of a thin section of the cell wall of an avocado during the climacteric rise in respiration. 30
4. Freeze fracture electron micrograph of the cell wall of a hard, unripe avocado. 30
5. Thin section electron micrograph of the cell wall of an avocado at the climacteric peak of respiration. 32
6. Freeze fracture electron micrograph of the cell wall of an avocado at the climacteric peak of respiration. 32
7. Electron micrograph of a thin section of the cell wall of a post climacteric, soft avocado. 34
8. Scanning electron micrograph of several mesocarp cells at the climacteric peak of respiration. 34
9. Higher magnification scanning electron micrograph of the cell wall of an avocado at the climacteric peak. 34

10.	Scanning electron micrograph of a very soft, post climacteric avocado.	34
11.	Freeze fracture replica of the cell wall of a post climacteric, soft avocado.	34
12.	Electron micrograph of the cell wall of a hard, unripe avocado showing branching plasmodesmata with enlarged median cavities.	36
13.	Electron micrograph of the cell wall of an avocado at the climacteric peak showing apparent stretching of the plasma membrane at the plasmodesmata.	36
14.	Electron micrograph of a cell wall of an unripe avocado which was stained for pectins.	36
15.	Electron micrograph of the cell wall of an unripe avocado. Control for pectin stain shown in fig. 14.	36

Chapter 3

1A.	Scanning electron micrograph of several mesophyll cells of a hard, unripe avocado.	52
1B.	Thin section electron micrograph of several cells from the mesocarp of a hard, unripe avocado.	52
1C.	Thin section electron micrograph of a portion of a mesophyll cell from a hard, unripe avocado.	52
1D.	Scanning electron micrograph of a portion of a mesophyll cell from a hard, unripe avocado.	52
2A.	Freeze fracture electron micrograph of a portion of a mesophyll cell from an avocado during the climacteric rise in respiration.	54
2B.	Freeze fracture electron micrograph of a lipid body in an avocado mesocarp cell. The fracture plane has apparently followed the surface of the lipid body.	54
2C.	Electron micrograph of a chloroplast from the outer, dark green mesophyll of an avocado.	54
2D.	Electron micrograph of portions of two cells from the light green mesocarp tissue of an avocado.	54
3A.	Electron micrograph of a portion of a cell from the inner yellow tissue of an avocado.	56
3B.	Electron micrograph of mitochondria in a mesocarp cell of an unripe avocado.	56
3C.	Serial section reconstruction of the mitochondria in fig. 3B showing them all to be interconnected into one single mitochondrion.	56
3D.	Electron micrograph of a portion of a mesocarp cell from an avocado at the climacteric peak showing intact mitochondria and vesiculating ER.	56

4A.	Scanning electron micrograph of a portion of a mesocarp cell from an avocado at the climacteric peak showing elongate mitochondria and other organelles.	58
4B.	Electron micrograph of a portion of a dark green mesophyll cell from a soft, post climacteric avocado showing integrity of the organelles.	58
4C.	Scanning electron micrograph of a sheet of ER wrapped around a lipid body.	58
4D.	Thin section electron micrograph of a portion of a cell from an avocado during the climacteric rise showing vesiculating ER.	58
4E.	Electron micrograph of an avocado at the climacteric peak illustrating apparent fusion of an ER vesicle with the plasma membrane.	58
5A.	Freeze fracture replica of the EF face of the plasma membrane of a preclimacteric avocado.	60
5B.	Freeze fracture electron micrograph of the EF face of the plasma membrane from an avocado at the climacteric peak.	60
5C.	Electron micrograph of a plastid from the light green portion of the mesocarp of an avocado.	60

Chapter 4

1.	Electron micrograph of an oil cell and surrounding mesophyll cells in the mesocarp of an avocado.	72
2.	Electron micrograph of portions of an oil cell and adjacent mesophyll cells in the mesocarp of an avocado.	72
3.	Electron micrograph of the cell wall of an oil cell showing the three layers of the wall.	72
4.	Electron micrograph of walls of an oil cell and adjacent parenchyma cells which have been stained for pectins.	72
5.	Electron micrograph of the cell wall of a parenchyma cell adjacent to an oil cell showing blockage of the plasmodesmata at the suberin layer.	74
6.	Electron micrograph of a plastid from the light green portion of the mesophyll of an avocado showing a membrane bound body.	74
7.	Freeze fracture replica of a plastid from the light green mesocarp tissue of an avocado.	74
8.	Freeze fracture electron micrograph of the inner and outer envelopes of a plastid from an avocado mesocarp cell.	74

LIST OF TABLES

Chapter 3

1. Histogram of particle densities of the EF face of the plasma membrane of avocado mesocarp cells at various stages of ripening. 50

Chapter 4

1. Densities of intramembranous particles in the chloroplast envelope as reported in the present study and in the literature. 69
2. Histogram of the frequency distribution of particle densities in the EF face of the plasma membrane of avocado mesocarp cells at various stages of ripening. 70
